

# 2-channel reversible motor driver

## BA6238A/BA6238AN/BA6239A/BA6239AN

The BA6238A, BA6238AN, BA6239A, and BA6239AN are monolithic ICs incorporating two reversible-motor drivers that are suitable for driving small DC brush motors.

The logic input section for controlling each motor can be easily connected with CMOSs and other control logic outputs. The torque during loading can be varied by controlling the voltage supplied to the motor with pin 8 of the output section.

With a limited number of external parts, each driver has a function of two reversible-motor drivers.

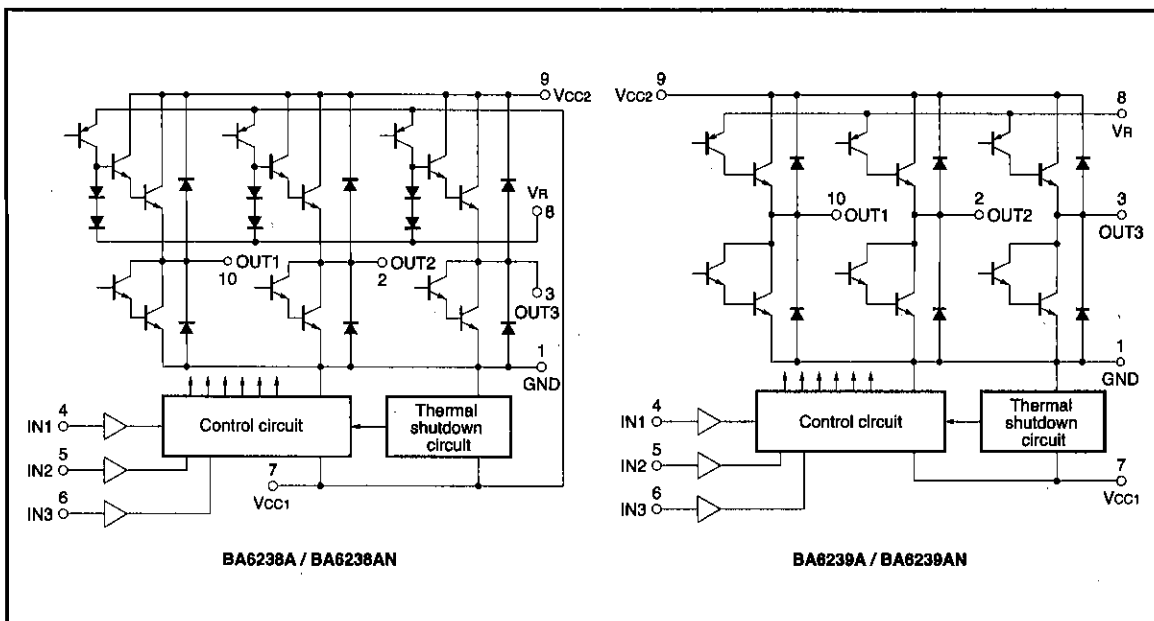

●Applications

VCRs and audio tape recorders

●Features

- 1) Two reversible-motor driver circuits are built in. (not operable at the same time)
- 2) Limited number of external parts.
- 3) Interface with CMOS devices. (protective resistor required when the CMOS output is higher than 5V)
- 4) Built-in power transistor for motor driving.
- 5) Built-in diode to absorb surge currents.
- 6) Built-in thermal shutdown circuit. (the circuit breaks the output when the chip temperature is increased due to such an event as motor locking)

●Block diagram

●Circuit operation

(1) Input (pins 4, 5, and 6)

These pins receive control logic signals. The relevant circuits are designed to have hysteresis and antinoise characteristics. The input circuit can control the logic by input currents of a few microamperes or more. The motor connected between pins 10 and 2 is selected when pin 4 is HIGH and pin 5 is LOW, while the motor connected between pins 10 and 3 is selected when pin 5 is HIGH and pin 4 is LOW. Pin 6 is the forward / reverse control input pin.

(2) Output (pins 2, 3, and 10)

Pin 10 is the common pin. Either pin 2 or 3 is left OPEN during motor driving. The waveform monitored on the OPEN pin will be the same as that on pin 10.

1) BA6238A/BA6238AN

The output stage configuration of the BA6238A/BA6238AN is shown in Fig. 5. The output stage contains NPN transistors in a Darlington configuration, which means the saturation voltage between  $V_{CC1}$  and the output pin is rather high but the output voltage can be easily set by using a zener diode or a resistor voltage divider. The voltage on the  $V_R$  pin can be varied from 0V to  $V_{CC1}$ . The output voltage is at the maximum when pin 8 is OPEN.

$$V_{OH} = V_{CC1} - V_{sat} \text{ (PNP)} - 2 \times V_{BE} \text{ (NPN Darlington)}$$

$$V_{OL} = V_{sat} \text{ (NPN Darlington)}$$

$V_{sat}$  and  $V_{BE}$  are functions of the output current (see Fig. 17).

2) BA6239A/BA6239AN

The output configuration of the BA6239A/BA6239AN is shown in Fig. 6. Because the output stage contains only one NPN transistor, the saturation voltage between pin 8 and the output pin is about 0.7V less than that in the BA6238A. The output voltage is controlled by the pin-8 voltage. The voltage on the  $V_R$  pin can be varied from 8V to  $V_{CC1}$ . The output voltage is at the maximum when pin 8 is  $V_{CC1}$ .

Fig.5

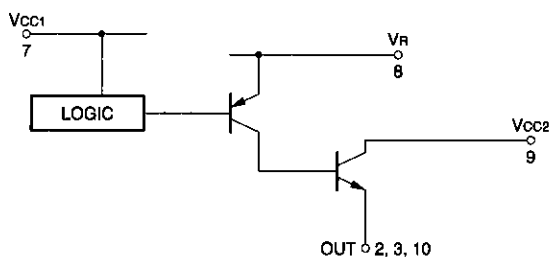

Fig.6

$$V_{OH} = V_R - V_{sat} \text{ (PNP)} - V_{BE} \text{ (NPN)}$$

$$V_{OL} = V_{sat} \text{ (NPN Darlington)}$$

$V_{sat}$  and  $V_{BE}$  are functions of the output current (see Fig. 18).

(3) Output control (pin 8)

Output voltage can be varied by controlling the pin-8 voltage.

1) BA6238A/BA6238AN

The pin-8 voltage can vary from 0V to  $V_{CC}$ . Because a constant current (0.6mA typically) flows out from pin 8, the output voltage can be controlled by using a zener diode or a resistor voltage divider.

2) BA6239A/BA6239AN

In addition to controlling the output voltage, pin 8 supplies base current to the high-side output transistor (NPN).

(4) Power supply (pins 7 and 9)

Pin 7 supplies power to the input, logic, and thermal shutdown circuits. Pin 9 supplies power to the output transistors.

(5) Thermal shutdown circuit

Regardless of the input mode, the thermal shutdown circuit puts the outputs to LOW level when the chip temperature rises due to such an event as motor locking. When the thermal shutdown circuit is deactivated, the outputs revert to the status determined by input mode.

The thermal shutdown circuit is activated when the chip temperature exceeds 150°C (125°C minimally), and deactivated when the chip temperature drops to 100°C (125°C maximally). The minimum temperature difference between the activation and deactivation settings is 10°C.

(6) Ground pin and fins

Pin 1 and the fins have the minimum potential within the IC. The PCB design should ensure that the common impedance is kept as low as possible when a large current flows.

● Operation notes

- (1) Though the IC input pins can be directly connected with MOS output pins, it is recommendable to connect resistors of about 3 ~ 30kΩ between the pins for the sake of pin protection (see Fig. 7).
- (2) When reversing the rotational direction of a motor, make sure to go through the brake mode in-between the opposite directions. It is recommendable to keep the brake mode for at least 10 μs.
- (3) Powering procedures should be designed so that V<sub>CC1</sub> (pin 7) always rises first and falls last.
