### APPLICATION EXAMPLE

### PRECAUTIONS FOR APPLICATION

Note the following when using the M52470AP. These notes should be fully taken into consideration.

- 1) A large signal to the audio input pins may disturb the video output signal, in case the voltage at the input pin drops to 1V or under (equivalent to AC 10V<sub>PP</sub> at  $V_{CC} = 12V$ ).

Make some arrangements so that no input signal of large amplitude may enter.

- 2) If the video circuit input pins are terminated by means of 75Ω resistors, the capacitance of coupling capacitors might become larger (several tens μF). When switching power on in that case, the video output will be unstable until the bias to the video output circuit becomes stable. Care should be taken when designing circuits and systems.
