LA3246

STEREO PREAMP FOR COMPACT DOUBLE CASSETTE  
PLAYBACK-ONLY USE

The LA3246 is a stereo preamp IC for double cassette tape playback-only use. The LA3246 is intended for use in portable radio-cassette tape recorders and tape decks.

**Applications**

- Stereo compact cassette player for playback-only use
- Stereo cassette deck player

**Functions**

- Preamp x 2, mixing amp x 1, electronic switch x 6

**Features**

- On-chip electronic switch for input select (auto reverse or A deck/B deck select)
- On-chip electronic switch for normal/higher dubbing select and electronic switch for metal/normal tape select
- Wide operating voltage range ( $V_{CC\ op}=3.5$  to 14V)
- With output MIX pin (for music select control)
- Low noise voltage ( $V_{NI}=0.9\mu V$  typ,  $R_g=2.2k\Omega$  NAB)
- Can be used in conjunction with the LA3240, 3241, 3242 to make up a double-cassette dubbing system.

**Maximum Ratings at  $T_a=25^\circ C$** 

		unit
Maximum Supply Voltage	$V_{CC\ max}$	16 V
Allowable Power Dissipation	$P_d\ max$	500 mW
Operating Temperature	$T_{opr}$	-20 to +75 $^\circ C$
Storage Temperature	$T_{stg}$	-40 to +125 $^\circ C$

**Operating Conditions at  $T_a=25^\circ C$** 

		unit
Recommended Supply Voltage	$V_{CC}$	6 V
Operating Voltage Range	$V_{CC\ op}$	3.5 to 14 V

**Package Dimensions 3021B**

(unit: mm)

Equivalent Circuit Block Diagram

Test Circuit

Sample Application Circuit

Unit (resistance: Ω, capacitance: F)

LA3246

- Note 1. The output frequency characteristic for Nor Tape/High Speed Mode (pin 6: High, pin 15: Low) and that for Metal Tape/Nor Speed Mode (pin 6: Low, pin 15: Low) are set to be the same.
2. Since the input bias current flows out of pins 1,2 and pins 19,20, a resistor (recommended value: 30kohms to 350kohms, maximum value: 500kohms) must be connected across pins 1,2 and GND and across pins 19,20 and GND when connecting a coupling capacitor in series with these pins.
3. #: A capacitor must be connected to the input to absorb a surge.
4. The electronic select switching level is approximately  $1/2 \times (V_{CC}-0.9)$ .
5. The value of the capacitor connected to pin 12 can be increased/decreased to adjust starting time  $t_s$  at the time of application of  $V_{CC}$ . ( $C=100\mu F$ ,  $t_s=0.4\text{sec.}$ ) If the capacitor value is made less than  $47\mu F$ , the ripple rejection will get worse.
6. No capacitor is connected to pin 13. (Even if connected, the ripple can not be rejected.)
7. Extreme caution should be exercised when handling the IC as it is subject to dielectric breakdown.

Sample Printed Circuit Pattern (Cu-foiled area)

Unit (resistance: Ω, capacitance: F)

**Proper cares in using the IC**

- (1) It is recommended to connect a surge absorbing capacitor across input pins 1,2 and GND and across input pins 19,20 and GND.
- (2) The base of a PNP transistor is connected to input pins 1,2 and 19,20. If an electrolytic capacitor is connected in series with the input pins, connect input resistor  $R_{IN}$  across input pin and GND. The value of  $R_{IN}$  must not exceed 500kohms. (Reason: To minimize the variation in output DC voltage at the time of input switching)

If a resistor of more than 500kohms is connected across input pin and GND, the noise (output) caused by amp 1 - amp 2 select is liable to increase at the time of F/R switching.

- (3) When an electrolytic capacitor is connected to input pins 1,2 (or 23,24), make the value of  $R_{IN1}$  as equal to that of  $R_{IN2}$  as possible.

The difference in the value between  $R_{IN1}$  and  $R_{IN2}$  causes the variation in amp output DC voltage at the time of F/R switching. Therefore, the input DC voltage (voltage across  $R_{IN}$ ) must be made as equal as possible.

- (4) The amp output characteristics are designed to be the same in the Nor Tape /High Speed (pin 15 GND/pin 6  $V_{CC}$ ) and Me Tape/Nor Speed (pin 15  $V_{CC}$ /pin 6 GND) modes. (Refer to Sample Application Circuit, external constants.)
- (5) When externally turning ON/OFF power supply pin 11 (by bringing pin 11 to  $+V_{CC}$ /GND level) with a capacitor connected to pin 13, connect external diode D, as shown below, so that no breakdown (or deterioration) of the IC system is caused by  $I_{CD}$  when the switch is turned OFF. When no capacitor is connected to pin 13, diode D is not required.

(6) The output MIX circuit is of the emitter follower configuration as shown below.

The MIX OUT output level  $V_o \text{ MIX}$  at the time a signal is applied to PRE1 (or PRE2) only is 1/2 as compared with output levels  $V_{o1}$ ,  $V_{o2}$  at the time the same input signal is applied to both channels.

$$V_o \text{ MIX} = \frac{1}{2} V_{o1} (= \frac{1}{2} V_{o2})$$

where  $V_{o1} = V_{o2}$

(7) Output waveform starting time

Example of rise waveform at pin 4 (or 17)

When supply voltage  $V_{CC}$  is switched ON, the amplifier output (pins 4,17) will rise. Output waveform ON time  $t_s$  can be varied by capacitor  $C_r$  connected to pin 12.

Refer to Data  $C_r - t_s$ .

The minimum value of  $C_r$  is 47uF.

(8) Electronic select switching level

. The switch level at  $V_{CC}=6.0V$  is shown below.

Pin	Switch Mode	Switching Level		Clamp Voltage	Control Current typ (flow-in) (at operation finish)	Mode	
		Operation Start	Operation Finish			(+)	(-)
6	Normal/Metal	2.1V	2.4V	3.7V	2uA	Metal	Normal
9	Forward/Reverse	2.1V	3.1V	3.4V	2uA	Reverse	Forward
15	Normal/Higher	2.1V	2.4V	3.7V	2uA	Higher	Normal

As shown above, there is a difference in the switching level at three control pins (6,9,15) between operation start and operation finish.

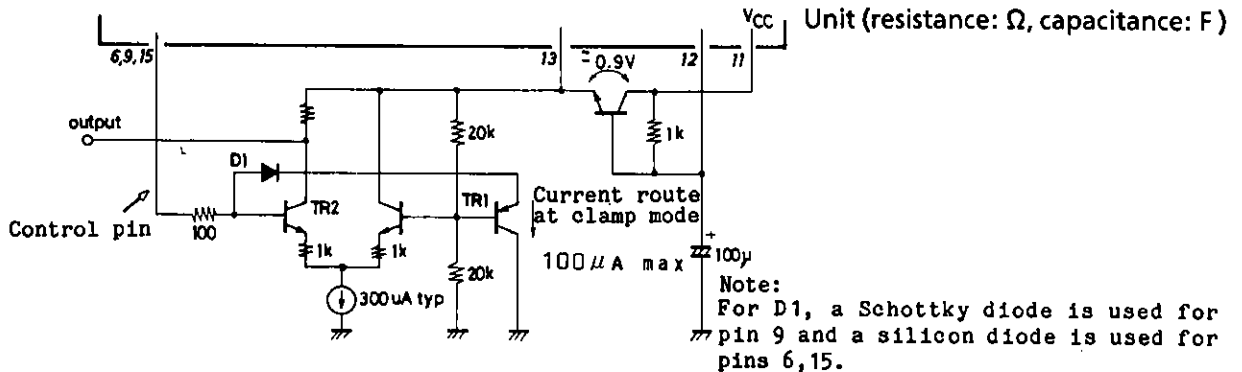

. Switching level and mode at each pin (experimental value)

Switching level (reverse) on pin ⑨ at  $V_{CC}=6.0V, T_a=25^\circ C$

. Control circuit

The control circuit for each CONT pin is configured as shown below. When a voltage more than a given value is applied, the level on the pin is fixed by clamp diode D1.

Description

- . Switching level  $V_{SW}$  of the control circuit is fixed by voltage  $V_{13}$  which is 1/2 of the voltage on pin 13.

$$V_{SW} = \frac{1}{2} V_{13}$$

- . Clamp voltage  $V_{CLP}$  at the time a voltage is applied to the CONT pin

$$V_{CLP} = \frac{1}{2} \times V_{13} + V_{D1} + V_{BE1}$$

$$= \frac{1}{2} \times V_{13} + 0.6(0.3) + 0.6$$

$$= \frac{1}{2} \times V_{13} + (0.9 \text{ or } 1.2)$$

where 0.9V is for pin 9.  
1.2V is for pins 6, 15.

- . The maximum voltage at which the CONT pin is brought to GND level is fixed by the level at which the Q2 is completely turned OFF. This level is:

$$\frac{1}{2} \times V_{13} - V_{BE2} = \frac{1}{2} \times V_{13} - 0.6 \text{ [V]}$$

Switching is performed at a level less than this.

- To turn ON/OFF  
When turning ON:

To turn ON the control circuit to finish the operation,  $I_B$  is required. Control voltage  $V_{OUT}$  is obtained with  $I_B$  of 4uA min.

- $V_{CONT} \text{ min} = R \times I_B \text{ max} + \text{Operation finish voltage}$   
 $I_B = 4\mu\text{A}$

Operation finish voltage

Pins (6), (15) :  $= 1/2 \times V_{13}$   
Pin (9) :  $= 1/2 \times V_{13} + V_{BE}$   
 $= 1/2 \times V_{13} + 0.6 \text{ [V]}$

- $V_{CONT} \text{ max} = R \times I_B \text{ max} + \text{Clamp voltage}$   
R is restricted by  $I_B \text{ max}$ .

When the supply voltage is fixed, clamp voltage  $V_{CLP}$  is fixed. When resistor R is fixed based on a balance with capacitor C, resistor R is restricted by  $V_{CONT} \text{ max}$ . as shown below.

$$I_B \text{ max} = 100\mu\text{A} \geq \frac{V_{CONT} \text{ max} - V_{CLP}}{R}$$

The minimum value of resistor R is fixed by this equation.

Example

Assuming  $V_{CC}=10\text{V}$ ,  $V_{CONT} \text{ max}=10\text{V}$ ,  $R_{\text{min}}$  is 50kohms.  
Therefore,  $R=100\text{kohms}$  presents no problem.

When turning OFF:

Bring the level on the CONT pin to a level less than:

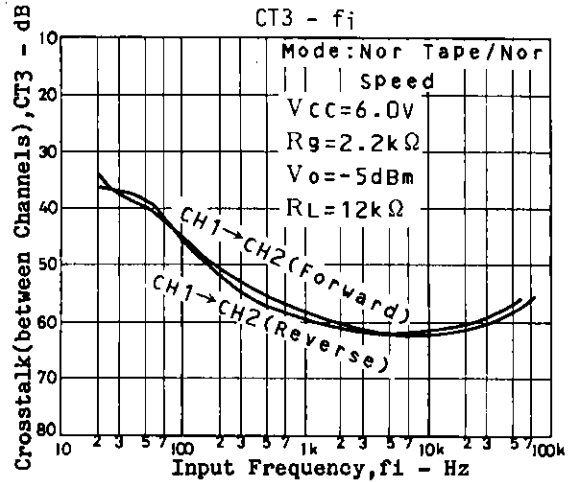

$$\frac{1}{2} \times V_{13} - V_{BE2} = \frac{1}{2} \times V_{13} - 0.6 \text{ [V]}$$
