

## DUAL DOLBY\* B—TYPE NOISE REDUCTION CIRCUIT

### GENERAL DESCRIPTION

The TEA0657 is a monolithic bipolar integrated circuit providing two channels of Dolby B-type noise reduction. The circuit contains all internal electronic switching to provide playback or record functions.

In addition the TEA0657 includes preamplifiers for the playback and record modes and multiplex filter buffers for both channels.

The device will operate with power supplies in the range of 9.0 V to 15.0 V, output overload level increasing with increase in supply voltage. Current drain varies with supply voltage and noise reduction ON/OFF so it is advisable to use a regulated power supply or, a supply with a long time constant.

### Features

- Dual noise reduction channels
- Full playback/record switching
- Separate playback/record inputs
- Multiplex filter buffers
- Simultaneous switching on both channels
- Dual or single supply operations
- Dolby reference level = 580 mV
- Input sensitivity = 30 mV

### QUICK REFERENCE DATA

**FUNCTIONAL DESCRIPTION**

Noise reduction is enabled when pin 22 is open-circuit and OFF when connected to pin 24 via a 5.1 k $\Omega$  resistor (see Fig. 3).

Pin 24 performs the functions of a logic input for noise reduction switching in both channels and provides smoothing for the control signal in one channel. It is important that no voltage is applied to this pin when in the NR ON mode as this will cause irregular noise reduction characteristics in the selected channel.

Record/playback is achieved by applying a DC voltage to pin 23. The circuit will enable the appropriate input for the selected mode.

**RATINGS**

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)
