MULTIPOWER BCD TECHNOLOGY

MOSFET OUTPUT POWER STAGE

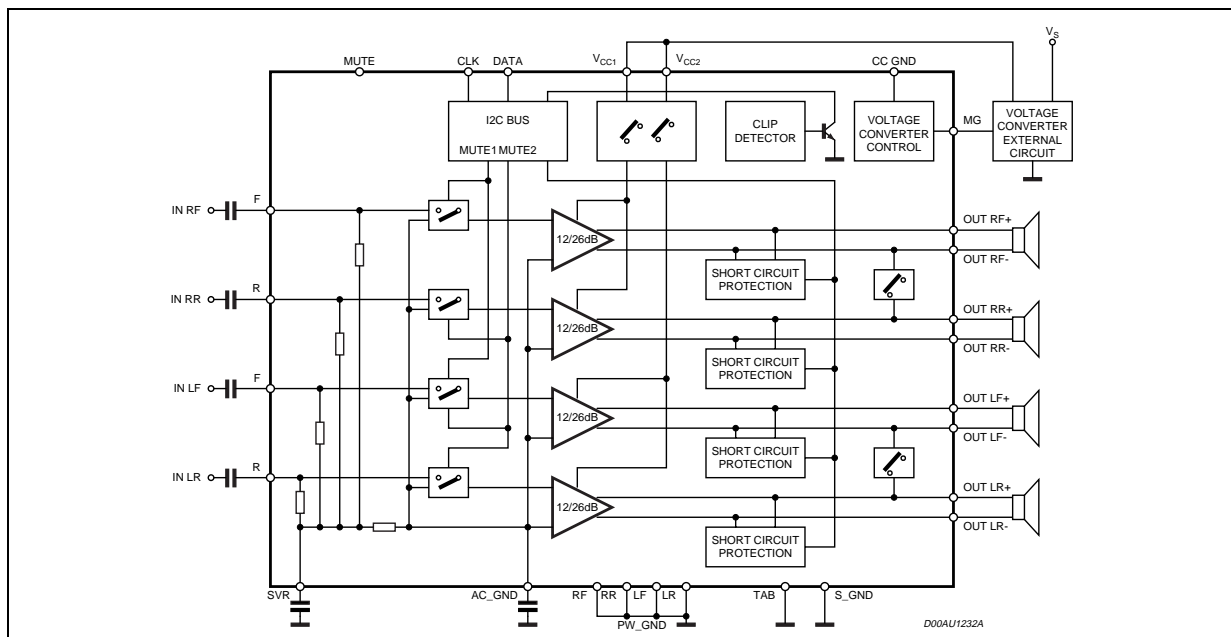

FLEXIWATT27

ORDERING NUMBER: TDA7565

DESCRIPTION

The TDA7565 is a new BCD technology QUAD BRIDGE type of car radio amplifier in Flexiwatt27 package specially intended for car radio applications. Thanks to the DMOS output stage the TDA7565 has a very low distortion allowing a clear powerful sound. The built-in voltage converter control block assures a very high output power with an extremely low number of added components. The dissipated power under average listening condition is aligned to the conventional solutions (4x40W).

I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7565 and viceversa takes place through the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

Data Validity

As shown by fig. 2, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

Start and Stop Conditions

As shown by fig. 3 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

Byte Format

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

Acknowledge

The transmitter* puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 22). The receiver** the acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

* Transmitter

- master (μ P) when it writes an address to the TDA7565
- slave (TDA7565) when the μ P reads a data byte from TDA7565

** Receiver

- slave (TDA7565) when the μ P writes an address to the TDA7565
- master (μ P) when it reads a data byte from TDA7565
