**Description:**

DIPIMPs are intelligent power modules that integrate power devices, drivers, and protection circuitry in an ultra compact dual-in-line transfer-mold package for use in driving small three phase motors. Use of 5th generation IGBTs, DIP packaging, and application specific HVICs allow the designer to reduce inverter size and overall design time.

**Features:**

- Compact Packages
- Single Power Supply
- Integrated HVICs
- Direct Connection to CPU
- Reduced  $R_{th}$

**Applications:**

- Refrigerators
- Air Conditioners
- Small Servo Motors
- Small Motor Control

**Ordering Information:**

PS21997-4 is a 600V, 30 Ampere short pin DIP Intelligent Power Module.

\* Short Circuit protection is functioning only for the low-arms. Please select the value of the external shunt resistor such that the SC trip level is less than 1.7 times the current rating.

\*\*Fault signal is asserted only for a UV or SC condition on the low side. On a SC fault the FO duration will be 40 $\mu\text{sec}$ . On a UV condition the fault signal will be asserted as long as the UV condition exists or for 40 $\mu\text{sec}$ , whichever is longer.

Notes:

- 1) To prevent input signal oscillations minimize wiring length to controller (~2cm). Additional RC filtering (C5 etc.) may be required. If filtering is added be careful to maintain proper dead time and voltage levels. See application notes for details.
- 2) Internal HVIC provides high voltage level shifting allowing direct connection of all six driving signals to the controller.
- 3) F<sub>O</sub> output is an open collector type. Pull up resistor (R3) should be adjusted to current sink capability of the controller.
- 4) Use only one V<sub>NC</sub> Pin (either 9 or 16) and leave the other open.
- 5) Boot strap supply component values must be adjusted depending on the PWM frequency and technique.
- 6) Wiring length associated with R<sub>SHUNT</sub>, R<sub>SF</sub>, C<sub>SF</sub> must be minimized to avoid improper operation of the OC function.
- 7) R<sub>SF</sub>, C<sub>SF</sub> set over current protection trip time. Recommend time constant is 1.5μs-2.0μs. See application notes.
- 8) Local decoupling/high frequency filter capacitors must be connected as close as possible to the modules pins.
- 9) The length of the DC link wiring between C5, C6, the DIP's P terminal and the shunt must be minimized to prevent excessive transient voltages. In particular C6 should be mounted as close to the DIP as possible.
- 10) Use high quality, tight tolerance current sensing resistor. Connect resistor as close as possible to the DIP's N terminal. Be careful to check for proper power rating. See application notes for calculation of resistance value.

## Protection Function Timing Diagrams

Short Circuit Protection (N-side Only with External Shunt Resistor and RC Filter)

- a1: Normal operation – IGBT turns on and carries current.
- a2: Short circuit current is detected (SC trigger).
- a3: All N-side IGBT's gate are hard interrupted.
- a4: All N-side IGBT's turn off.
- a5:  $F_O$  output with a fixed pulse width (determined by the external capacitance  $C_{FO}$ ).
- a6: Input "L" – IGBT off.
- a7: Input "H" – IGBT on, but during the  $F_O$  output period the IGBT will not turn on.
- a8: IGBT turns on when L→H signal is input after  $F_O$  is reset.

Under-Voltage Protection (N-side , UV<sub>D</sub>)

- b1: Control supply voltage  $V_D$  rises – After  $V_D$  level reaches under voltage reset level ( $UV_{Dr}$ ), the circuits start to operate when next input is applied.
- b2 : Normal operation – IGBT turns on and carries current.
- b3:  $V_D$  level dips to under voltage trip level ( $UV_{Dt}$ ).
- b4: All N-side IGBT's turn off in spite of control input condition.
- b5:  $F_O$  is low for a minimum period determined by the capacitance  $C_{FO}$  but continuously during UV period.
- b6:  $V_D$  level reaches  $UV_{Dr}$ .
- b7: Normal operation – IGBT turns on and carries current.
